Utrecht University

## 16. Q&A, Summary, Farewell

# This lecture

## Q&A, Summary, Farewell

Questions and Answers

Summary and Farewell

# 16.1 Questions and Answers

# Common pitfall 1: grammar vs. language

- ▶ A **language**  $L$  is a subset of the words of an alphabet  $X$ .
  - ▶ A **word**  $w \in X^*$  is a sequence of symbols from  $X$ .
  - ▶ Our main question is **acceptance**: does word  $w$  belong to language  $L$ ?
  - ▶ After some time, we want **efficient** acceptance.

# Common pitfall 1: grammar vs. language

- ▶ A **language**  $L$  is a subset of the words of an alphabet  $X$ .
  - ▶ A **word**  $w \in X^*$  is a sequence of symbols from  $X$ .
  - ▶ Our main question is **acceptance**: does word  $w$  belong to language  $L$ ?
  - ▶ After some time, we want **efficient** acceptance.
- ▶ A **grammar** is a way to describe a language.
  - ▶ Some grammars are nicer than others:
    - ▶ Regular, context-free.

# Common pitfall 1: grammar vs. language

- ▶ A **language**  $L$  is a subset of the words of an alphabet  $X$ .
  - ▶ A **word**  $w \in X^*$  is a sequence of symbols from  $X$ .
  - ▶ Our main question is **acceptance**: does word  $w$  belong to language  $L$ ?
  - ▶ After some time, we want **efficient** acceptance.
- ▶ A **grammar** is a way to describe a language.
  - ▶ Some grammars are nicer than others:
    - ▶ Regular, context-free.
  - ▶ A language can be described by **many** different grammars.
  - ▶ **Warning!** A **regular** language can be described by at least one regular grammar, but many others (non-regular) may describe it, too.

## Common pitfall 2: automata have an error state

Transitions are **total** functions,  $d :: Q \rightarrow X \rightarrow Q$ .

## Common pitfall 2: automata have an error state

Transitions are **total** functions,  $d :: Q \rightarrow X \rightarrow Q$ .

## Common pitfall 2: automata have an error state

Transitions are **total** functions,  $d :: Q \rightarrow X \rightarrow Q$ .

# Common pitfall 3: pumping lemma

General structure of pumping lemma

$L$  is reg./ctx.-free  $\implies$   $L$  has property  $P$

# Common pitfall 3: pumping lemma

General structure of pumping lemma

$L$  is reg./ctx.-free  $\implies L$  has property  $P$

Small logic reminder

$A \implies B$  is logically equivalent to  $\neg B \implies \neg A$

# Common pitfall 3: pumping lemma

General structure of pumping lemma

$L$  is reg./ctx.-free  $\implies$   $L$  has property  $P$

Logically equivalent formulation

$L$  does **not** have property  $P \implies L$  is **not** reg./ctx.-free

Consequence

You **cannot** use the lemma to prove that  $L$  **is** reg./ctx.-free

# How to prove it then?

L is **regular**. Give me **one** of the following:

- ▶ Deterministic finite state automaton,
- ▶ Non-deterministic finite state automaton,
- ▶ Regular grammar, or
- ▶ Regular expression.

L is **context-free**. Give me **one** of the following:

- ▶ (Context-free) grammar, or
- ▶ Pushdown automaton.

# How to prove it then?

L is **LL(1)**:

- ▶ Context-free grammar,
- ▶ Lookahead sets for each production, and
- ▶ The sets for each non-terminal must be disjoint.

L is **LR(0)**:

- ▶ Construct the LR(0) automaton,
  - ▶ The thing with markers  $\bullet$  in the rules.
- ▶ There must be **no** conflicts.

## 16.2 Summary and Farewell

# Brief course summary

- ▶ Build a simple compiler
  - ▶ Parsing using **combinators**
  - ▶ **Code generation** for a stack machine
  - ▶ Use **folds** to express the phases

# Brief course summary

- ▶ Build a simple compiler
  - ▶ Parsing using **combinators**
  - ▶ **Code generation** for a stack machine
  - ▶ Use **folds** to express the phases
- ▶ A bit of **language and automata theory**
  - ▶ Grammars, languages, pumping lemmas
  - ▶ **Fixpoint** algorithms

# Brief course summary

- ▶ Build a simple compiler
  - ▶ Parsing using **combinators**
  - ▶ **Code generation** for a stack machine
  - ▶ Use **folds** to express the phases
- ▶ A bit of **language and automata theory**
  - ▶ Grammars, languages, pumping lemmas
  - ▶ **Fixpoint** algorithms
- ▶ **Efficient** parsing algorithms
  - ▶ LL(1), LR(0), a bit or LR(1)
  - ▶ Key idea: **lookahead**

# From a simple to a realistic compiler

## 1. Parsing

- ▶ Usually dealt with with a parser generator

# From a simple to a realistic compiler

1. Parsing
  - ▶ Usually dealt with with a parser generator
2. Static analyses
  - ▶ We want to catch errors before they happen
    - ▶ Compile-time vs. run-time
  - ▶ Type systems are an important asset

# From a simple to a realistic compiler

1. Parsing
  - ▶ Usually dealt with with a parser generator
2. Static analyses
  - ▶ We want to catch errors before they happen
    - ▶ Compile-time vs. run-time
  - ▶ Type systems are an important asset
3. Program optimization

# From a simple to a realistic compiler

1. Parsing
  - ▶ Usually dealt with with a parser generator
2. Static analyses
  - ▶ We want to catch errors before they happen
    - ▶ Compile-time vs. run-time
  - ▶ Type systems are an important asset
3. Program optimization
4. Code generation
  - ▶ Real architectures are more complex than SSM
  - ▶ Nowadays, you usually generate code in an intermediate language, like LLVM

# Helium

- ▶ Helium (<http://www.github.com/Helium4Haskell>)
- ▶ Developed in Utrecht, since around 2002, revived a few years back
- ▶ (Very) close to the Haskell 2010 standard
- ▶ Focus on good type error diagnosis
- ▶ Moving from LVM (bytecode) backend to LLVM backend (C)
- ▶ Looking at advanced Haskell type system features: GADTs, type families, ...

## Some technical details

- ▶ Handwritten parser using monadic parser combinators (Parsec)
- ▶ Haskell  $\rightarrow$  Core  $\rightarrow$  Iridium  $\rightarrow$  LLVM
- ▶ Tree traversals/folds implemented using attribute grammars (11 datatypes, some with 15 or 22 constructors)
- ▶ Strictness analysis, region analysis, uniqueness typing

# Computation theory

We have just scratched the surface of **computation** theory

- ▶ More **formal** treatment of languages

# Computation theory

We have just scratched the surface of **computation** theory

- ▶ More **formal** treatment of languages
- ▶ What about **unrestricted** grammars?
  - ▶ Turing machines,  $\lambda$ -calculus,  $\mu$ -recursive functions.
  - ▶ Is there anything outside? **Non-computable** functions!

# Computation theory

We have just scratched the surface of **computation** theory

- ▶ More **formal** treatment of languages
- ▶ What about **unrestricted** grammars?
  - ▶ Turing machines,  $\lambda$ -calculus,  $\mu$ -recursive functions.
  - ▶ Is there anything outside? **Non-computable** functions!
- ▶ How much time/space does it take to compute?
  - ▶ This is called **complexity** theory
  - ▶ Some algorithms are linear, other exponential. . .
  - ▶ The famous  $P = NP$  problem belongs here

# What more?

We happen to have a **master** program about this!

- ▶ Concepts of program design
  - ▶ How do programming languages look like?
  - ▶ How do we formally describe execution of a program?
- ▶ Program semantics and verification
  - ▶ How do you check that a program satisfies its specification?
  - ▶ Testing, model checking
- ▶ Automatic program analysis
  - ▶ The rest of the phases: static analyses and code generation
  - ▶ Monotone frameworks, type-and-effect systems

Success with your exams!
